FOUNDATION

Type

All dynamic languages are static languages with a single type

Any

Any => Any

```scala
def inc(value: Any): Any = value match {
  case x: Int    => x + 1
  case x: Double => x + 1
  case x: Char   => x.toString + "1"
  case x: String => x + "1"
}
```

Any => Any

```scala
def inc(value: Any): Any = value match {
  case x: Int    => x + 1
  case x: Double => x + 1
  case x: Char   => x.toString + "1"
  case x: String => x + "1"
}
```

```scala
scala> inc(5)
res0: Any = 6

scala> inc(10.3)
res1: Any = 11.3

scala> inc('c')
res2: Any = c1
```

Any => Any

```scala
def inc(value: Any): Any = value match {
  case x: Int    => x + 1
  case x: Double => x + 1
  case x: Char   => x.toString + "1"
  case x: String => x + "1"
}
```

```scala
scala> inc(5)
res0: Any = 6

scala> inc(10.3)
res1: Any = 11.3

scala> inc('c')
res2: Any = c1
```

```scala
scala> inc(java.time.Instant.ofEpochMilli(0))
scala.MatchError: 1970-01-01T00:00:00Z (of class java.time.Instant)
  at .inc(<console>:2)
  ... 43 elided
```
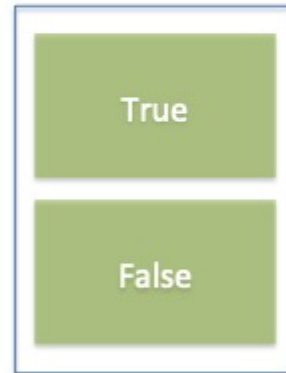

Plan

- What is the impact of types on our program? How to measure it?

- How to select types and tests to write more correct programs

- Explore relationship between types, algebra and logic

Type

Boolean

| True |
| --- |
| False |

Int

-28364
1
0

MinInt

Type

$|Boolean| = 2$

True
False

$|Int| = 2\text{^}32$

1 -28364 0 456 MaxInt 2 10 MinInt

Cardinality of a type should exactly fit business requirement

Type too big

```scala
def getCurrency(country: String): String =
  country match {
    case "France" | "Germany" => "EUR"
    case "United Kingdom"     => "GBP"
    case "Switzerland"        => "CHF"
    case _                    => ???
  }
```

Type too big

```scala
def getCurrency(country: String): Option[String] =
  country match {
    case "France" | "Germany" => Some("EUR")
    case "United Kingdom"      => Some("GBP")
    case "Switzerland"         => Some("CHF")
    case _                     => None
  }
```

Type just right

```scala
sealed trait Country

case object France        extends Country
case object Germany       extends Country
case object UnitedKingdom extends Country
case object Switzerland   extends Country

sealed trait Currency

case object EUR extends Currency
case object GBP extends Currency
case object CHF extends Currency

def getCurrency(country: Country): Currency =
  country match {
    case France | Germany => EUR
    case UnitedKingdom     => GBP
    case Switzerland       => CHF
  }
```

Type too big

```scala
case class Person(name: String, streetNumber: Option[Int], streetName: Option[String])

def fullAddress(person: Person): Option[String] =
  (person.streetNumber, person.streetName) match {
    case (Some(x), Some(y)) => Some(s"$x $y")
    case (Some(x), None   ) => ???
    case (None   , Some(y)) => ???
    case (None   , None   ) => None
  }
```

```scala
scala> fullAddress(Person("John", Some(108), Some("Canon Street")))
res4: Option[String] = Some(108 Canon Street)

scala> fullAddress(Person("John", None, None))
res5: Option[String] = None
```

Type just right

```scala
case class Address(streetNumber: Int, streetName: String)
case class Person(name: String, address: Option[Address])

def fullAddress(address: Address): String =
  s"${address.streetNumber} ${address.streetName}"

def fullPersonAddress(person: Person): Option[String] =
  person.address.map(fullAddress)
```

Type too big

```scala
// quantity must be positive
case class Item(id: String, quantity: Int, price: Double)

// order must have at least one item
case class Order(id: String, items: List[Item]){
  def total: Double =
    items.map(i => i.quantity * i.price).sum
}
```

Type too big

```scala
// quantity must be positive
case class Item(id: String, quantity: Int, price: Double)

// order must have at least one item
case class Order(id: String, items: List[Item]){
  def total: Double =
    items.map(i => i.quantity * i.price).sum
}
```

```scala
def halfPriceFirstItem(order: Order): Order = {
  val firstItem = order.items.head
  val discounted = firstItem.copy(price = firstItem.price / 2)
  order.copy(items = discounted :: order.items.tail)
}
```

Type too big

```scala
// quantity must be positive
case class Item(id: String, quantity: Int, price: Double)

// order must have at least one item
case class Order(id: String, items: List[Item]){
  def total: Double =
    items.map(i => i.quantity * i.price).sum
}
```

```scala
def halfPriceFirstItem(order: Order): Order = {
  order.items match {
    case Nil     => ???
    case x :: xs =>
      val discounted = x.copy(price = x.price / 2)
      order.copy(items = discounted :: xs)
  }
}
```

Type just right

```scala
import cats.data.NonEmptyList
import cats.implicits._

// quantity must be positive
case class Item(id: String, quantity: Int, price: Double)

case class Order(id: String, items: NonEmptyList[Item]){
  def total: Double =
    items.foldMap(i => i.quantity * i.price)
}
```

```scala
def halfPriceFirstItem(order: Order): Order = {
  val firstItem  = order.items.head
  val discounted = firstItem.copy(price = firstItem.price / 2)
  order.copy(items = NonEmptyList(discounted, order.items.tail))
}
```

Even further

```scala
import cats.data.NonEmptyList
import cats.implicits._
import eu.timepit.refined.types.numeric.PosInt

case class Item(id: String, quantity: PosInt, price: Double)

case class Order(id: String, items: NonEmptyList[Item]){
  def total: Double =
    items.foldMap(i => i.quantity.value * i.price)
}
```

```scala
def halfPriceFirstItem(order: Order): Order = {
  val firstItem  = order.items.head
  val discounted = firstItem.copy(price = firstItem.price / 2)
  order.copy(items = NonEmptyList(discounted, order.items.tail))
}
```

Type too small

```
import java.util.Date
```

```
scala> val fifthMarch = new Date(1551818168101L)
fifthMarch: java.util.Date = Tue Mar 05 20:36:08 UTC 2019
```

Type too small

```
import java.util.Date
```

```
scala> val fifthMarch = new Date(1551818168101L)
fifthMarch: java.util.Date = Tue Mar 05 20:36:08 UTC 2019
```

```
scala> List(1,2,3,4).size
res6: Int = 4
```

Type too small

```
import java.util.Date
```

```scala
scala> val fifthMarch = new Date(1551818168101L)
fifthMarch: java.util.Date = Tue Mar 05 20:36:08 UTC 2019
```

```scala
scala> List(1,2,3,4).size
res6: Int = 4
```

```scala
def parseJson(json: String): Option[Json] = ???
```

Function

Function

Input

Output

a

b

c

28

2

17

34

1
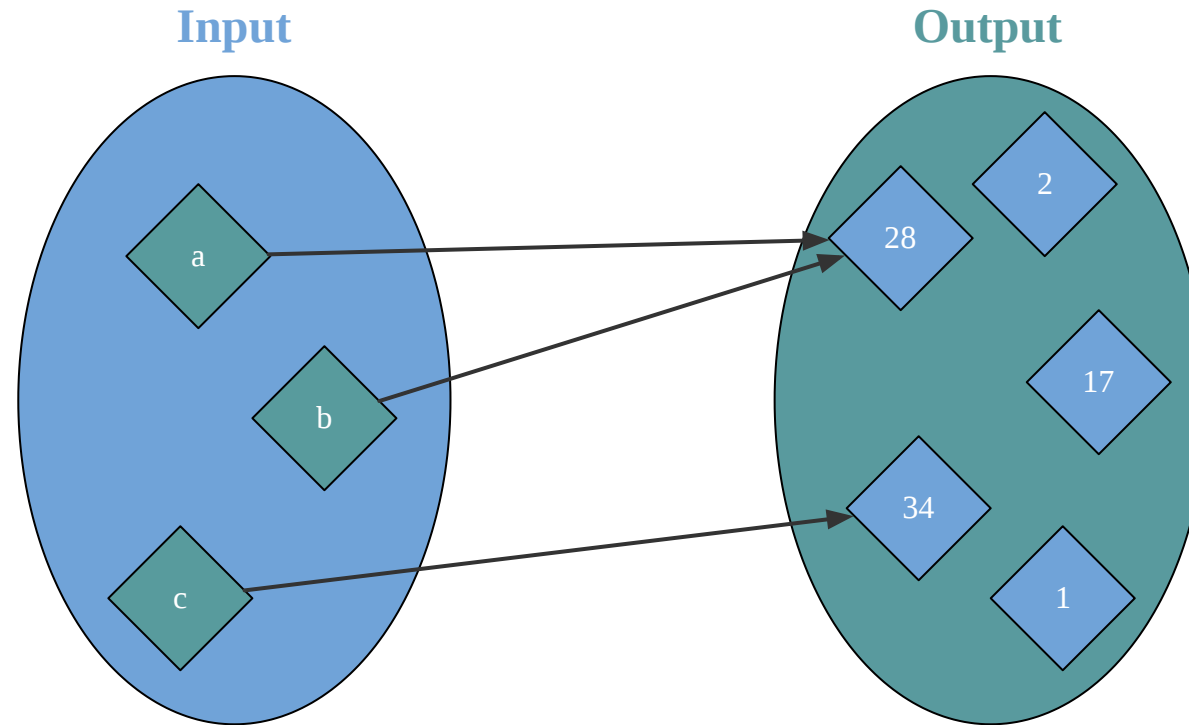

```scala
val isEven: Int => Boolean =
    x => x % 2 == 0

val increment: Int => Int =
    x => x + 1
```

# Type is a set

Type is a set

&&

A => B is a type

A => B is a set!

A => B

Function is a set!

Int => Int

x => x + 2

x => 1

x => factorial(x) % 25

x => x - 5
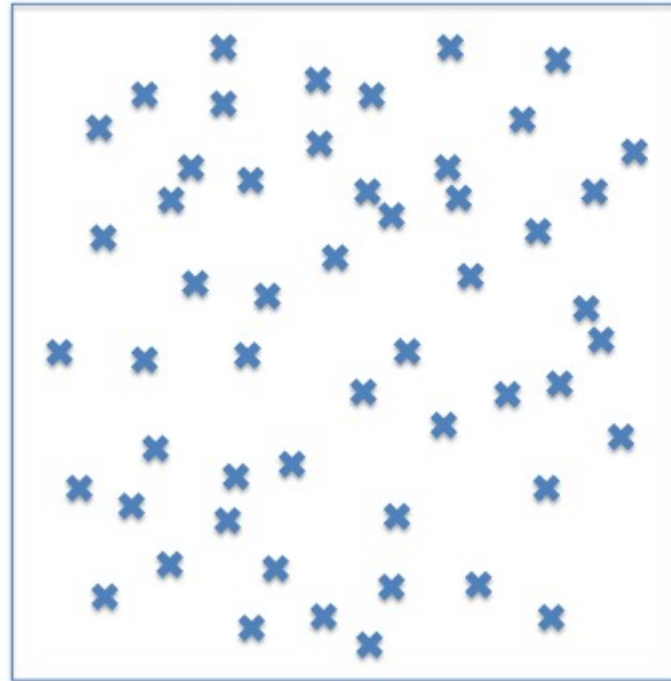

|A => B| represents how many implementations exist

The smaller $|A \Rightarrow B|$, the better

Ultimate goal $|A => B| = 1$

How to calculate |A => B| ?

```scala
def getCurrency1(country: String ): Option[String] = ???

def getCurrency2(country: Country): Currency = ???
```

How to calculate |A => B| ?

```
def getCurrency1(country: String ): Option[String] = ???

def getCurrency2(country: Country): Currency = ???
```

Intuitively

```
|getCurrency2| < |getCurrency1|
```

Exercise 1

Sealed trait cardinality

```
sealed trait IntOrBoolean

case class AnInt(value: Int) extends IntOrBoolean
case class ABoolean(value: Boolean) extends IntOrBoolean
```

Sealed trait cardinality

```
sealed trait IntOrBoolean

case class AnInt(value: Int) extends IntOrBoolean
case class ABoolean(value: Boolean) extends IntOrBoolean
```

```
AnInt(Int.MinValue) // ~ -2 billion
...
AnInt(0)
AnInt(1)
...
AnInt(Int.MaxValue) // ~ +2 billion
```

Sealed trait cardinality

```scala
sealed trait IntOrBoolean

case class AnInt(value: Int) extends IntOrBoolean
case class ABoolean(value: Boolean) extends IntOrBoolean
```

```scala
AnInt(Int.MinValue) // ~ -2 billion
...
AnInt(0)
AnInt(1)
...
AnInt(Int.MaxValue) // ~ +2 billion
```

```scala
ABoolean(false)
ABoolean(true)
```

Sealed trait cardinality

```scala
sealed trait IntOrBoolean

case class AnInt(value: Int) extends IntOrBoolean
case class ABoolean(value: Boolean) extends IntOrBoolean
```

```scala
AnInt(Int.MinValue) // ~ -2 billion
...
AnInt(0)
AnInt(1)
...
AnInt(Int.MaxValue) // ~ +2 billion
```

```scala
ABoolean(false)
ABoolean(true)
```

```
|IntOrBoolean| = |AnInt| + |ABoolean|
              = |Int|   + |Boolean|
```

Case class cardinality

```scala
case class IntAndBoolean(i: Int, b: Boolean)
```

Case class cardinality

```
case class IntAndBoolean(i: Int, b: Boolean)
```

```
IntAndBoolean(Int.MinValue, false)  // ~ -2 billion
...
IntAndBoolean(0, false)
IntAndBoolean(1, false)
...
IntAndBoolean(Int.MaxValue, false) // ~ +2 billion
```

Case class cardinality

```
case class IntAndBoolean(i: Int, b: Boolean)
```

```
IntAndBoolean(Int.MinValue, false)  // ~ -2 billion
...
IntAndBoolean(0, false)
IntAndBoolean(1, false)
...
IntAndBoolean(Int.MaxValue, false) // ~ +2 billion
```

```
IntAndBoolean(Int.MinValue, true)  // ~ -2 billion
...
IntAndBoolean(0, true)
IntAndBoolean(1, true)
...
IntAndBoolean(Int.MaxValue, true) // ~ +2 billion
```

Case class cardinality

```scala
case class IntAndBoolean(i: Int, b: Boolean)
```

```scala
IntAndBoolean(Int.MinValue, false)  // ~ -2 billion
...
IntAndBoolean(0, false)
IntAndBoolean(1, false)
...
IntAndBoolean(Int.MaxValue, false) // ~ +2 billion
```

```scala
IntAndBoolean(Int.MinValue, true)  // ~ -2 billion
...
IntAndBoolean(0, true)
IntAndBoolean(1, true)
...
IntAndBoolean(Int.MaxValue, true) // ~ +2 billion
```

```scala
|IntAndBoolean| = |Int| * |Boolean|
```

A sealed trait is called a Sum type

A sealed trait is called a Sum type

A case class is called a Product type

A sealed trait is called a Co-Product

A case class is called a Product

# Exercise 2
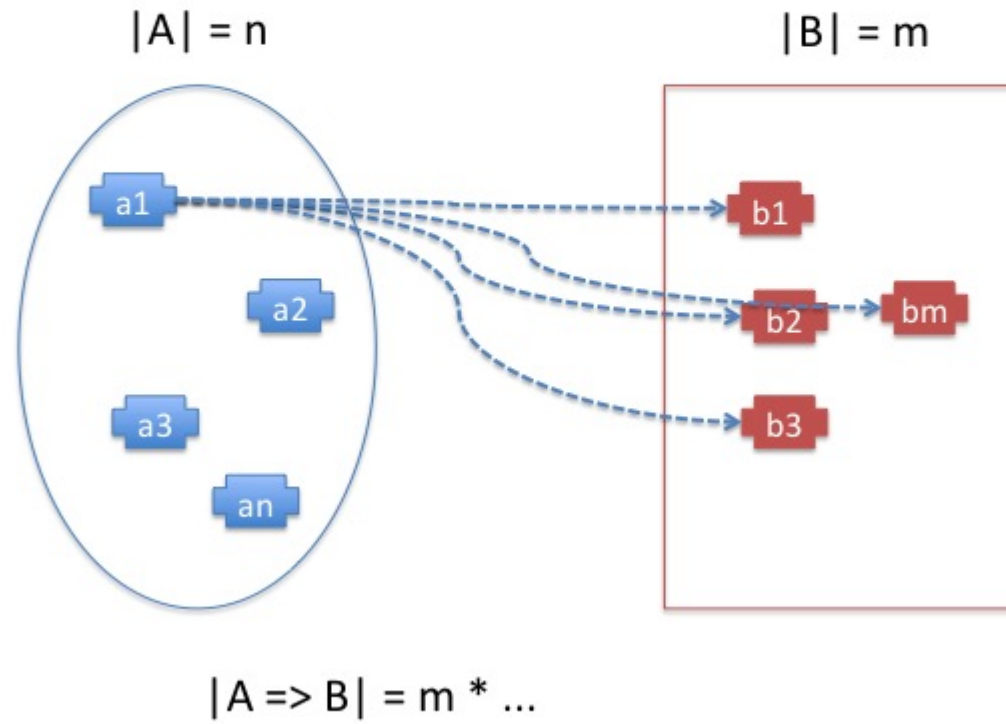

$$|A \Rightarrow B|$$

Function is a mapping

|A => B|

|A| = n |B| = m

a1, a2, a3, an

b1, b2, b3, bm

|A => B|

|A| = n |B| = m

a1 → b1
a2
a3   b2 → bm
an   b3

|A => B| = m * ...

|A => B|

|A| = n |B| = m

|A => B| = m * m * ...

|A => B|

$|A| = n$

$|B| = m$

a1

a2

a3

an

b1

b2

bm

b3
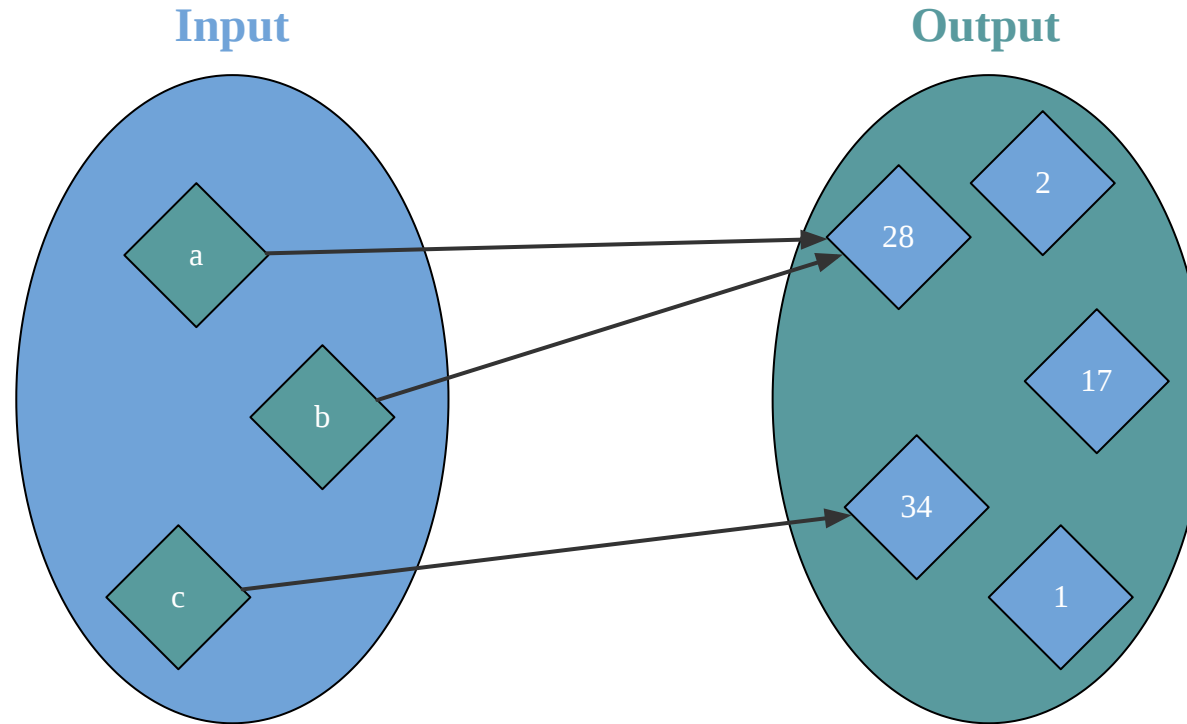

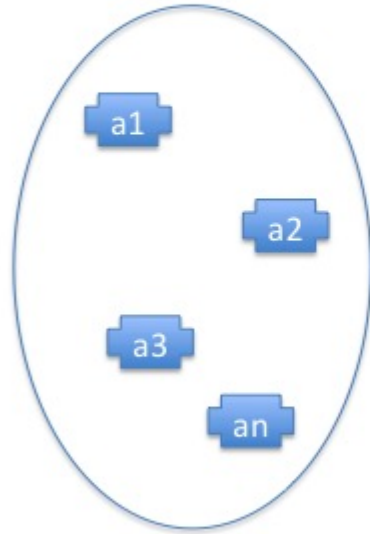

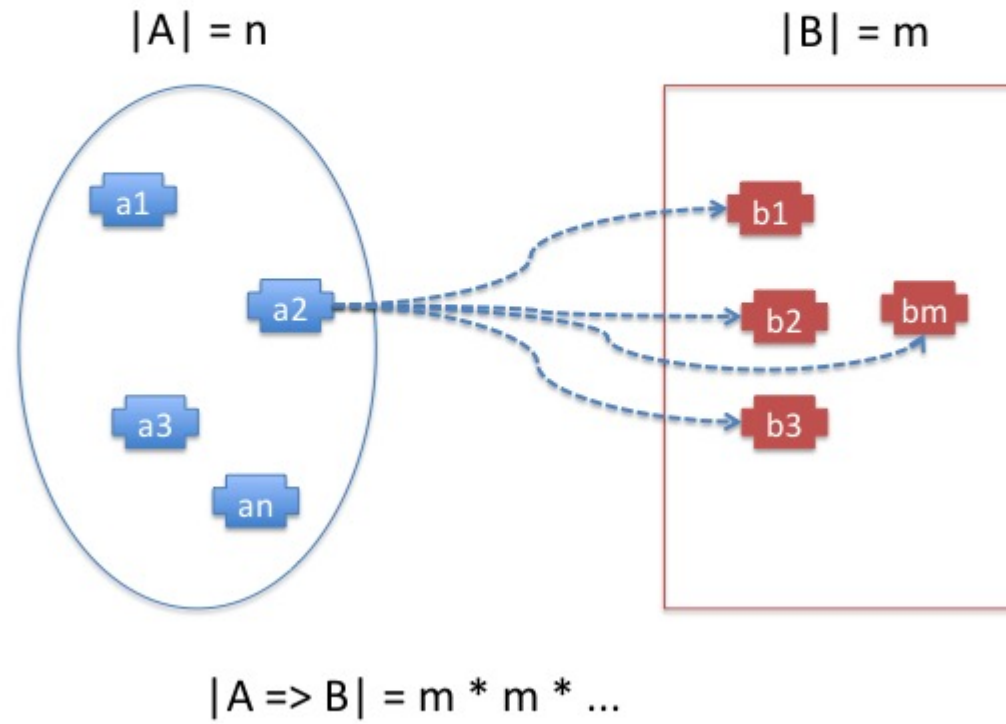

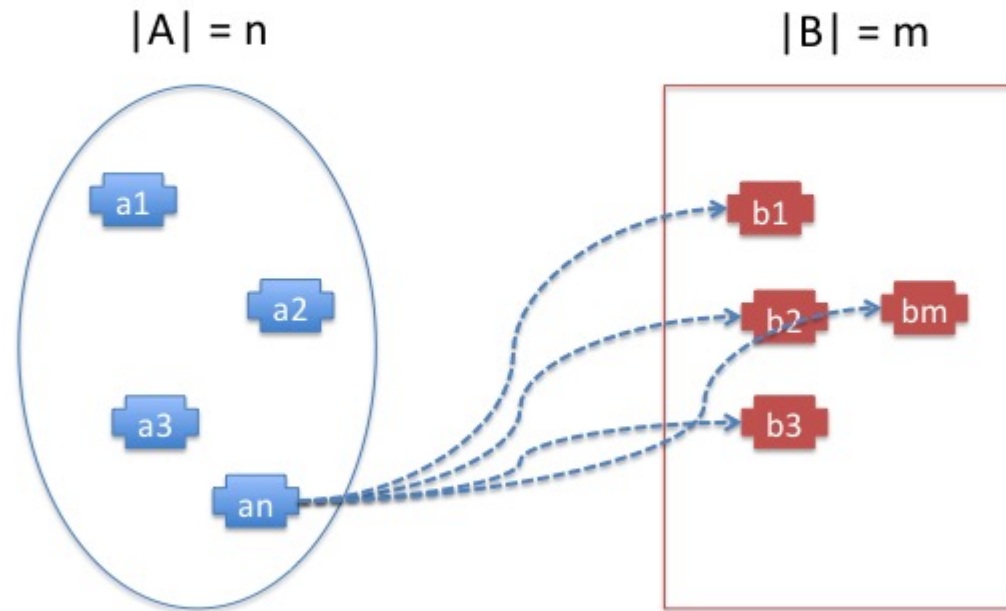

$|A => B| = m * m * ... * m$

$= m \wedge n = |B| \wedge |A|$

Exercise 3

Function is a set!

Int => Int

x => x + 2

x => 1

x => factorial(x) % 25

x => x - 5
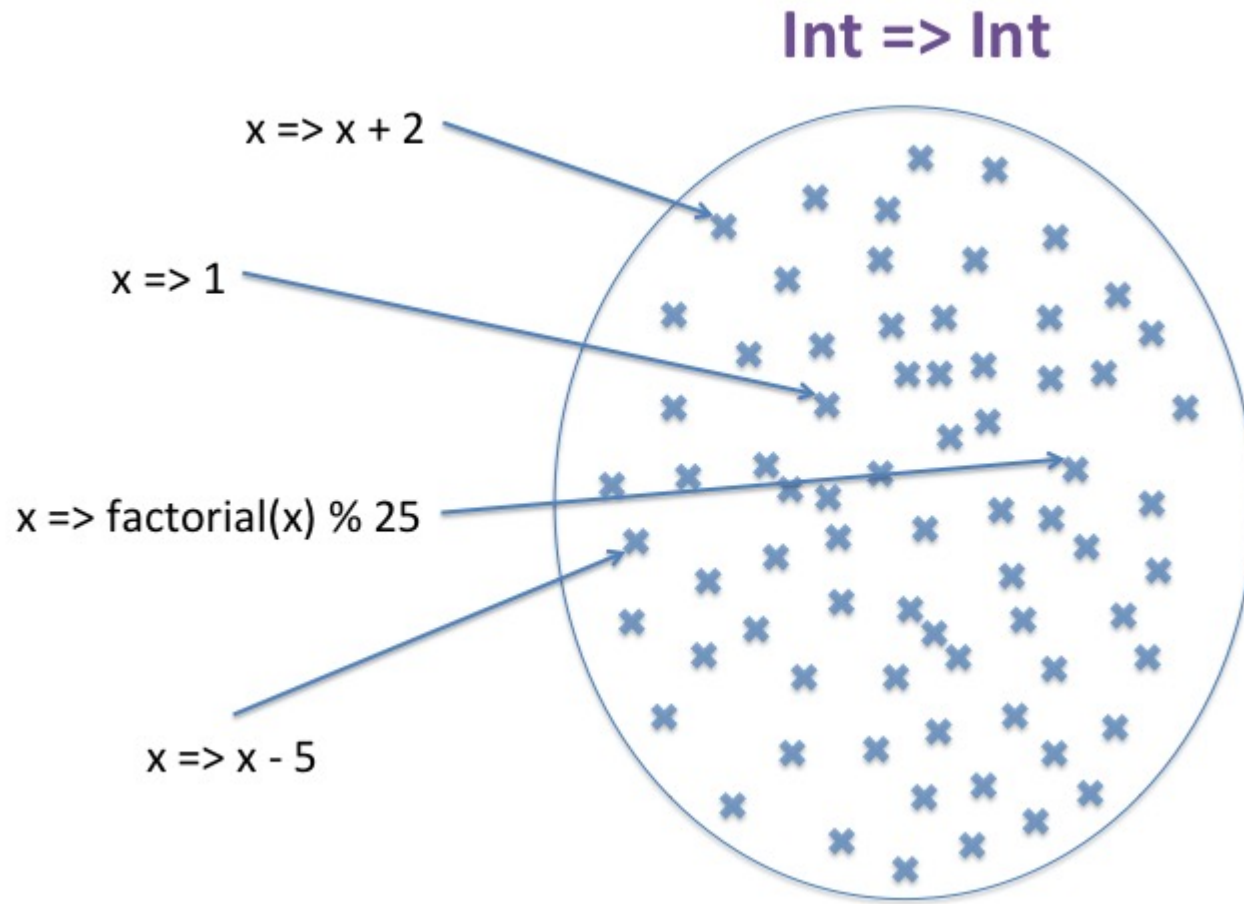

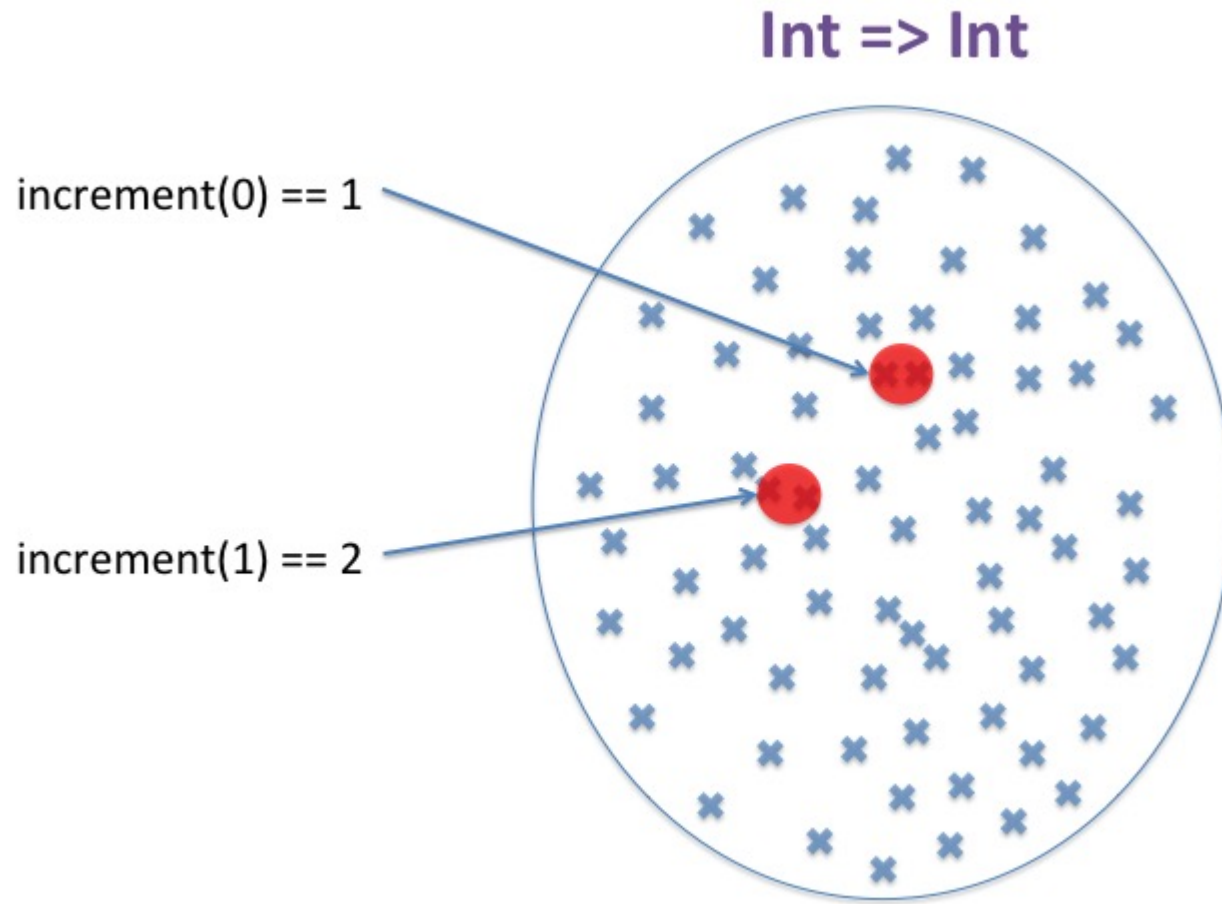

Unit Tests

Valid Implementation Count (VIC)

VIC(f: A => B) = number of impl - impl invalid by tests
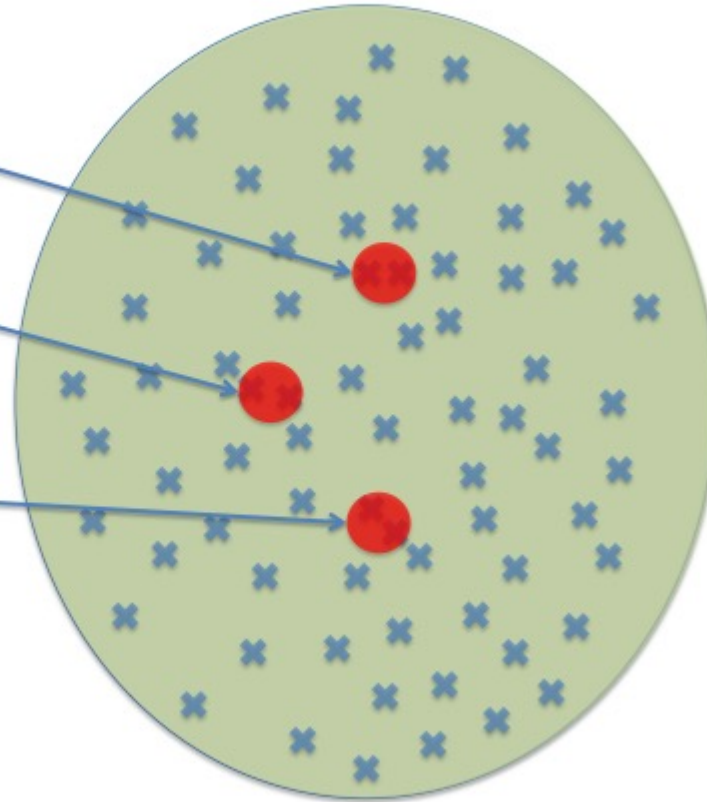

The smaller is VIC, the more f is constrained

VIC(f) = 1
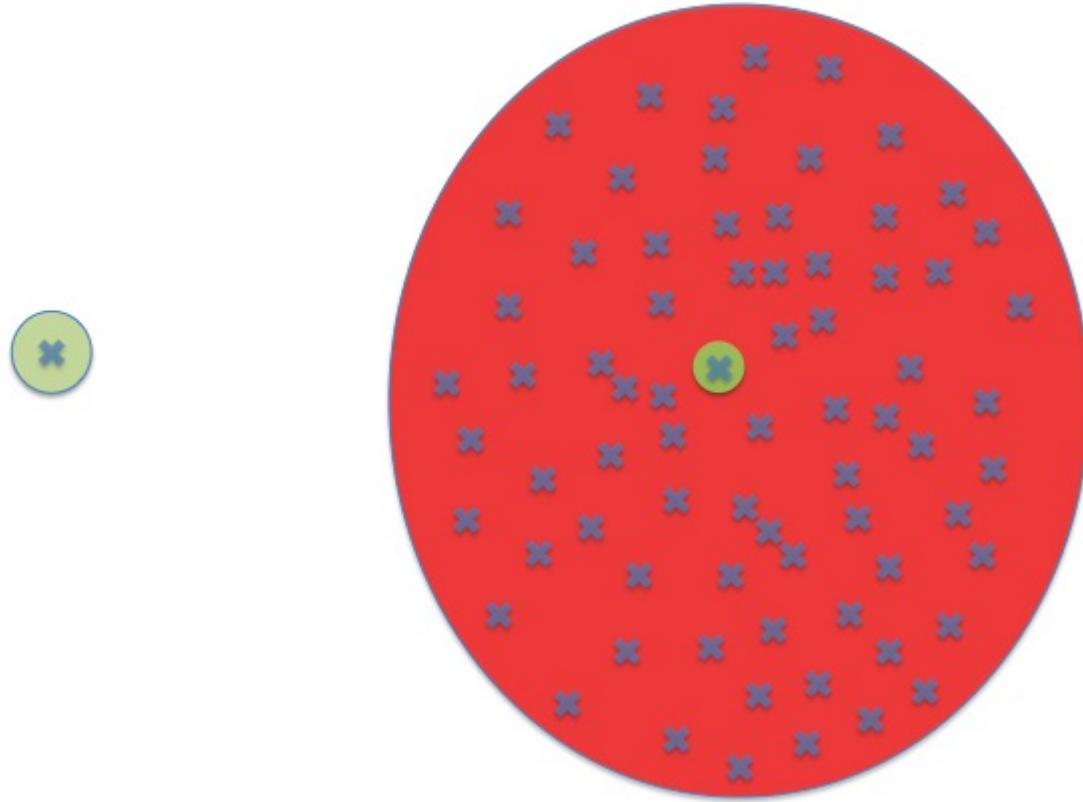

VIC(f: A => B) = **number of impl** - impl invalid by tests

$$|A => B| = |B| \verb|^| |A|$$

VIC(f: A => B) = number of impl - **impl invalid by tests**

Unit Test

```scala
sealed trait DayOfWeek

case object Monday  extends DayOfWeek
case object Tuesday extends DayOfWeek
// ...
case object Sunday  extends DayOfWeek
```
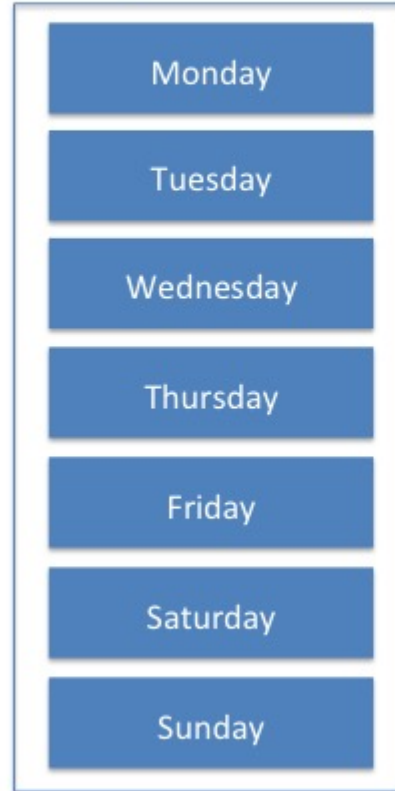

```scala
val f: DayOfWeek => Boolean = ???
```

such as

```scala
assert(f(Tuesday) == false)
```

Unit Test

DayOfWeek
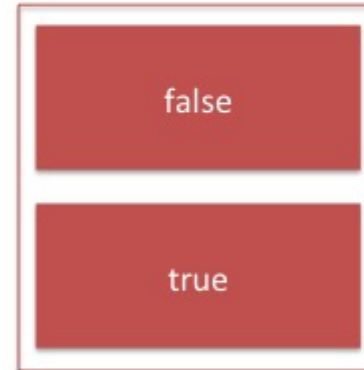

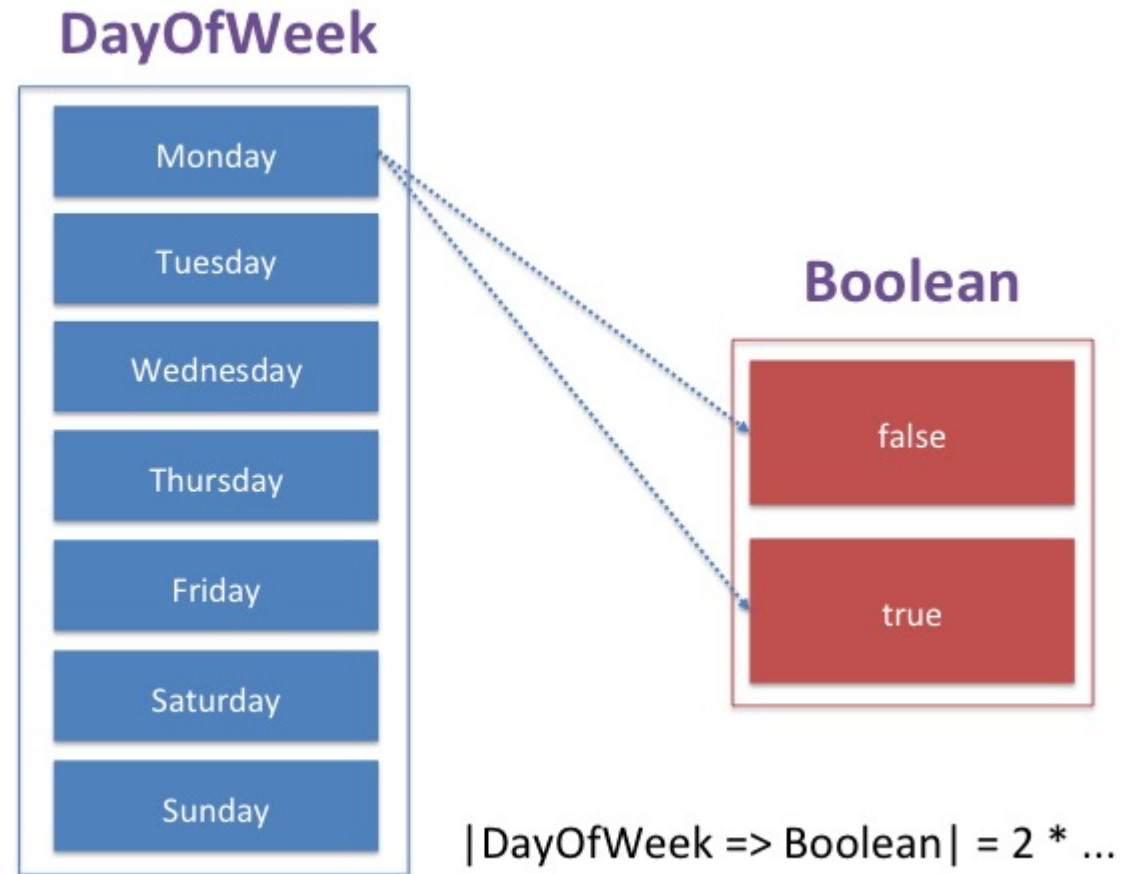

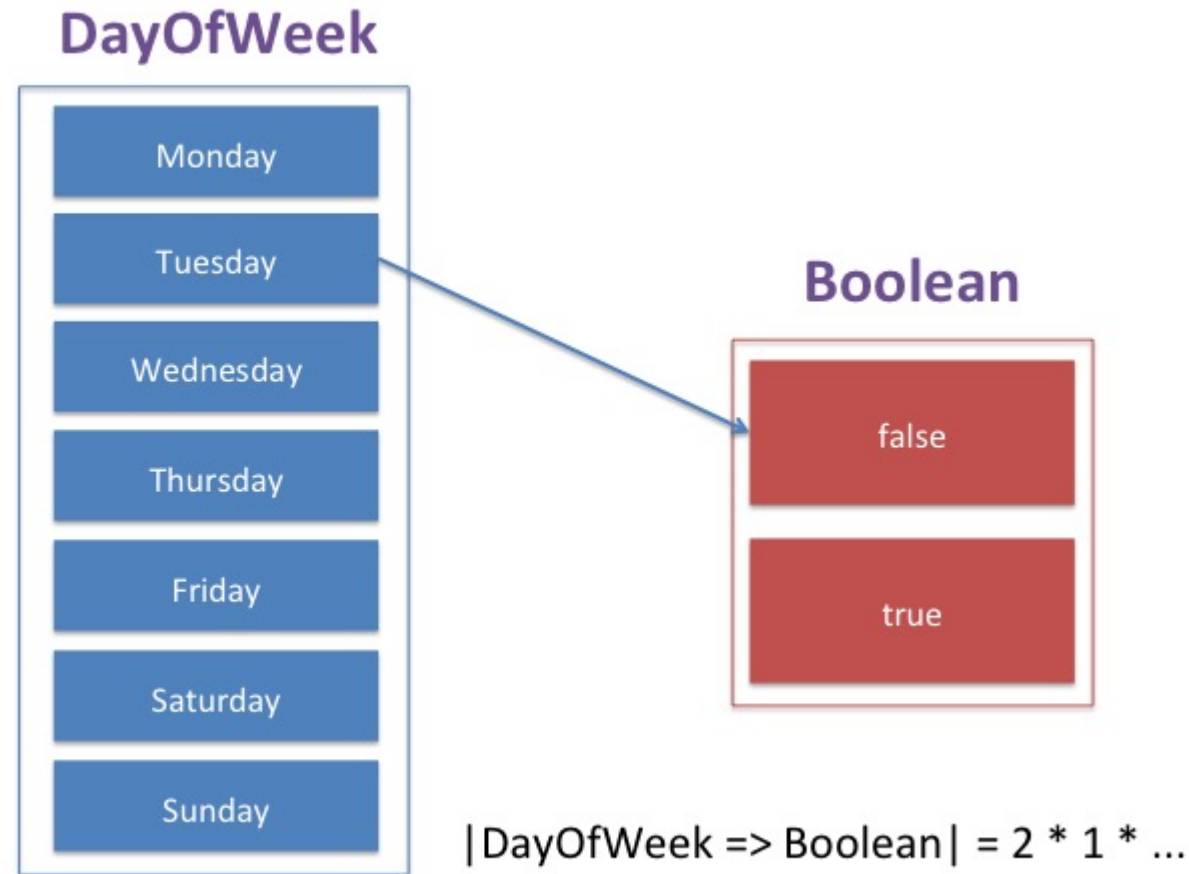

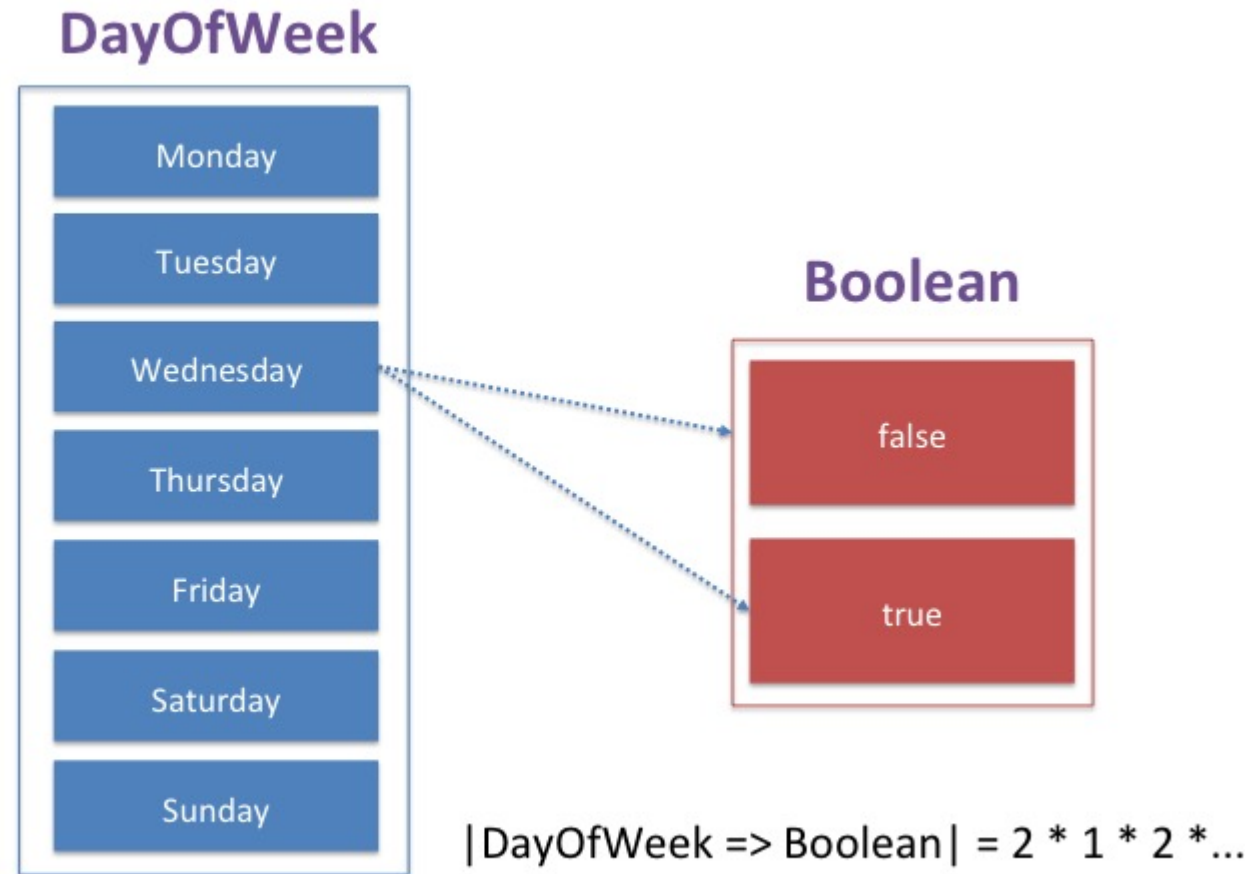

Monday

Tuesday

Wednesday

Thursday

Friday

Saturday

Sunday

Boolean

false

true

Unit Test

DayOfWeek

Monday
Tuesday
Wednesday
Thursday
Friday
Saturday
Sunday

Boolean

false

true

|DayOfWeek => Boolean| = 2 * ...

Unit Test

DayOfWeek

Monday
Tuesday
Wednesday
Thursday
Friday
Saturday
Sunday

Boolean

false
true

|DayOfWeek => Boolean| = 2 * 1 * …

Unit Test

DayOfWeek

Monday
Tuesday
Wednesday
Thursday
Friday
Saturday
Sunday

Boolean

false
true

|DayOfWeek => Boolean| = 2 * 1 * 2 *...

One Unit Test

```
VIC(f: A => B) = |A => B| / |B|
              = |B| ^ |A| / |B|
              = |B| ^ (|A| - 1)
```

One Unit Test

```
VIC(f: A => B) = |A => B| / |B|
              = |B| ^ |A| / |B|
              = |B| ^ (|A| - 1)
```

Two Unit Tests

```
VIC(f: A => B) = |A => B| / |B| / |B|
              = |B| ^ |A| / |B| / |B|
              = (|B| ^ |A|) / (|B| ^ 2)
              = |B| ^ (|A| - 2)
```

$$\text{VIC}(f: A \Rightarrow B) = |B| \wedge (|A| - n)$$

where n is the number of unit tests

Exercise 4 and 5

Type Algebra

Type	Algebra
Nothing	0
Unit	1
Either[A, B]	A + B
(A, B)	A * B
A => B	B ^ A
Isomorphism	A == B

Curry–Howard isomorphism

[Propositions as types](#) from Philip Wadler

Type Algebra Logic

Type	Algebra	Logic
Nothing	0	⊥ (false)
Unit	1	⊤ (true)
Either[A, B]	A + B	A ∨ B (or)
(A, B)	A * B	A ∧ B (and)
A => B	B ^ A	A → B (implies)
Isomorphism	A == B	A ⇔ B (equivalence)

Type Algebra Logic

Type	Algebra	Logic
Nothing	0	⊥
Unit	1	⊤
Either[A, B]	A + B	A ∨ B
(A, B)	A * B	A ∧ B
A => B	B ^ A	A → B
Isomorphism	A == B	A ⇔ B

```
Either[A, Nothing] == A
```

```
Either[A, Nothing] == A
```

$$A \lor \bot \Leftrightarrow A$$

```
(A, Nothing) == Nothing
```

```
(A, Nothing) == Nothing
```

```
A ∧ ⊥ ⇔ ⊥
```

Find the representation that makes sense to you

```
Either[Int, String] => Boolean       <==>       (Int => Boolean, String => Boolean)
```

Find the representation that makes sense to you

```
Either[A, B] => C    <==>    (A => C, B => C)
```

Find the representation that makes sense to you

```
Either[A, B] => C    <==>    (A => C, B => C)
```

Algebra

```
Either[A, B] => C = C ^ (A + B)
                  = C ^ A * C ^ B
                  = (A => C, B => C)
```

Logic

```
Either[A, B] => C = (A ∨ B) → C
                  = (A → C) ∧ (B → C)
                  = (A => C, B => C)
```

Summary

- Cardinality of types matter

- Unit tests offer almost no benefit in term of correctness

- `VIC(f: A => B) = |B| ^ (|A| - n)`

- Two techniques to achieve correctness

  - Property based testing
  - Parametric polymorphism
