FOUNDATION

Reader Writer State

There 3 different kind of exposed variables

Read Variables

```scala
case class Config(feature: Boolean, maxSize: Int)

class Bar(config: Config) {

  def blah(x: Int): List[Int] =
    if(config.feature) List.fill(x min config.maxSize)(5)
    else Nil

  def foo(b: Boolean): Int =
    if(b) 10 else 5

}

val bar1 = new Bar(Config(true , 2))
val bar2 = new Bar(Config(false, 6))
```

Read Variables

```scala
case class Config(feature: Boolean, maxSize: Int)

class Bar(config: Config) {

  def blah(x: Int): List[Int] =
    if(config.feature) List.fill(x min config.maxSize)(5)
    else Nil

  def foo(b: Boolean): Int =
    if(b) 10 else 5

}

val bar1 = new Bar(Config(true , 2))
val bar2 = new Bar(Config(false, 6))
```

```scala
scala> bar1.blah(3)
res0: List[Int] = List(5, 5)

scala> bar2.blah(3)
res1: List[Int] = List()
```

Read Variables

```scala
def blah(config: Config, x: Int): List[Int] = {
  if(config.feature)
    List.fill(x min config.maxSize)(5)
  else
    Nil
}

def foo(b: Boolean): Int =
  if(b) 10 else 5
```

Read Variables

```scala
def blah(config: Config, x: Int): List[Int] = {
  if(config.feature)
    List.fill(x min config.maxSize)(5)
  else
    Nil
}

def foo(b: Boolean): Int =
  if(b) 10 else 5
```

```scala
scala> blah(Config(true , 2), 3)
res2: List[Int] = List(5, 5)

scala> blah(Config(false, 6), 3)
res3: List[Int] = List()
```

Read Variables

```
class OrderRepository(dbConnection: Connection){

  def listOrder: List[Order] = ...

  def deleteOrder(id: Int): Unit = ...

}
```

Read Variables

```scala
class OrderRepository(dbConnection: Connection){

  def listOrder: List[Order] = ...

  def deleteOrder(id: Int): Unit = ...

}
```

```scala
object Main extends App {

  val dbConnection = initialiseConnection

  val orderRepository = new OrderRepository(dbConnection)

  val userRepository  = new UserRepository(dbConnection)

}
```

Read Variables != Constants

```scala
val pi = 3.14

def circleCircumference(radius: Double): Double =
  2 * pi * radius
```

Read Variables != Constants

```
val pi = 3.14

def circleCircumference(radius: Double): Double =
  2 * pi * radius
```

```
def circleCircumference(radius: Double): Double =
  2 * pi * 3.14
```

Write Variables

```scala
val log: StringBuffer = new StringBuffer()

def doSomething(x: Int): Int = {
  log.append(s"called doSomething with $x\n")
  x % 2
}
```

Write Variables

```scala
val log: StringBuffer = new StringBuffer()

def doSomething(x: Int): Int = {
  log.append(s"called doSomething with $x\n")
  x % 2
}
```

```scala
scala> doSomething(5)
res4: Int = 1

scala> doSomething(6)
res5: Int = 0

scala> log
res6: StringBuffer =
called doSomething with 5
called doSomething with 6
```

Write Variables

```scala
var countCall: Int = 0

def isEven(x: Int): Boolean = {
  countCall += 1
  x % 2 == 0
}

def isOdd(x: Int): Boolean = {
  countCall += 1
  x % 2 == 1
}
```

Write Variables

```scala
var countCall: Int = 0

def isEven(x: Int): Boolean = {
  countCall += 1
  x % 2 == 0
}

def isOdd(x: Int): Boolean = {
  countCall += 1
  x % 2 == 1
}
```

```scala
scala> isEven(5)
res7: Boolean = false

scala> isEven(6)
res8: Boolean = true

scala> isOdd(6)
res9: Boolean = false

scala> countCall
res10: Int = 3
```

Write Variables

```scala
val five = isEven(5)
val six  = isEven(6)
```

```
scala> countCall
res11: Int = 2
```

Write Variables

```
val five = isEven(5)
val six  = isEven(6)
```

```
scala> countCall
res11: Int = 2
```

```
val five = isEven(5)
val six  = !five
```

```
scala> countCall
res12: Int = 1
```

Read / Write Variables

```scala
var count: Int = 0

def inc(n: Int): Int = {
  count += n
  count
}
```

Read / Write Variables

```scala
var count: Int = 0

def inc(n: Int): Int = {
  count += n
  count
}
```

```
scala> inc(5)
res13: Int = 5

scala> inc(2)
res14: Int = 7

scala> inc(5)
res15: Int = 12
```

Read / Write Variables

```scala
var seed: Int = 10

def genInt: Int = {
  seed = 7 * seed % 11
  seed
}
```

Read / Write Variables

```scala
var seed: Int = 10

def genInt: Int = {
  seed = 7 * seed % 11
  seed
}
```

```scala
scala> genInt
res16: Int = 4

scala> genInt
res17: Int = 6

scala> genInt
res18: Int = 9
```
